

CLAIMS

1. Telephone-watch comprising at least one control member (107, 108a, 108b) and a case (101) in which there is mounted an electroacoustic transmitter transducer (103) in communication with an acoustic output cavity (117) arranged in said case and in direct communication the exterior via at least one output
5 channel (109a, 109b), characterized in that said at least one output channel opens out on the same side of the case as said control member (107) with respect to a 6 – 12 o'clock axis of the watch.
2. Telephone-watch according to claim 1, characterized in that it includes means (118) for guaranteeing water-resistance between said electroacoustic
10 transmitter transducer (103) and said acoustic output cavity (117).
3. Telephone-watch according to claim 1 or 2, characterized in that it includes two output channels (109a, 109b) opening out on either side of one of said control members (108a) and on the same side of the case with respect to the 6 – 12 o'clock axis.
- 15 4. Telephone-watch according to claim 3, characterized in that said output channels (109a, 109b) are oriented along different directions.
5. Telephone-watch according to any of claims 1 to 4, characterized in that it further includes an electroacoustic receiver transducer (104) mounted in said case (101) and in communication with an acoustic input cavity, the latter being
20 arranged in said case and in communication with the exterior via at least one input channel (110) opening out on the opposite side of said case to said control member (107) with respect to the 6 – 12 o'clock axis.
6. Telephone-watch according to claim 5, characterized in that it includes means for guaranteeing water-resistance between said electroacoustic receiver
25 transducer (104) and said acoustic input cavity.
